METHOD FOR TREATING A MEDIUM WITH ULTRASONIC TRANSDUCERS

Prior Application

This is a continuation-in-part application of U.S.

Still Pending

patent application serial no. 10/451,962, filed 27 June 2003

that claims priority from PCT application no. PCT/SE02/02195,

filed 28 November 2002, that claims priority from US

provisional patent application serial no. 60/339,380, filed 11

December 2001.

Technical Field

The present invention is a method for treating slurry or a liquid, such as sludge or polluted water in sewage works, with ultrasonic transducers.

Background and Summary of Invention

Ultrasonic energy has been applied to liquids in the past. Sufficiently intense ultrasonic energy applied to a liquid, such as water, produces cavitation that can induce changes in the physiochemical characteristics of the liquid. The subject of sonochemistry, which deals with phenomena of that sort, has grown very much during recent years.

The published material in sonochemistry and related subjects all pertains to batch processes, that is, the liquid solution or dispersion to be treated is placed in a container. The liquid in the container is then stirred or otherwise agitated, and ultrasound is applied thereto. It is then
